

CLEAR TEACHING:

With Direct Instruction, Siegfried Engelmann Discovered a Better Way of Teaching (81 pps.) Full copy on nifdi.org

By Shepard Barbash

(excerpts)

INTRODUCTION

What if Charles Darwin had written *The Origin of Species* and nobody noticed? Or Copernicus had shown that the earth went around the sun and nobody believed him? Or Jonas Salk had found a cure for polio and nobody cared? Such has been the fate of Siegfried Engelmann, pioneering inventor of a better way to teach that almost nobody uses.

Engelmann has spent the last 50 years working out answers to basic questions every good teacher asks. What should I teach my students? How can I teach them so that they *all* learn what I'm trying to teach? How can I accelerate their learning as much as possible and help those who are behind? How do I know in what order to teach things and what not to teach at all? How will I know *right away* if a student is learning or is confused and needs help? *How* do I re-teach? How do I get my students to pay attention and work hard? How do I get them to trust me? How do I get them to trust themselves? In sum, how can I become the best teacher possible?

Unlike education theorists whose vague ideas rarely help anyone in the classroom, Engelmann stands alone for his ability to design clear instructional programs that can accelerate learning in even the hardest to teach children and that any willing teacher can learn to use. Known as Direct Instruction, his approach puts teachers firmly in charge of their students' learning and gives them a reliable, cost-effective way to verify how well they are actually teaching.

More scientific evidence validates the effectiveness of his methods than any other approach to instruction.

Engelmann has written more than a hundred curricula using Direct Instruction (DI) principles, covering all the major subjects from preschool to high school. He tests his programs in the classroom, and uses the results to improve them. He has taught every program he has designed and has trained others meticulously in his methods. More scientific evidence validates the effectiveness of his methods than any other approach to instruction. Yet so different are his techniques and curricula from anything else in education that even now, after so many years, few educators understand them, few colleges teach them, and barely 2% of K-12 teachers use them. Like Copernicus, whose proofs were rejected by the Church for 300 years, Engelmann remains a scorned revolutionary, anathema or simply unknown to most people in his field.

APPENDIX II: RESEARCH ON DIRECT INSTRUCTION

Meta-Analyses and Synthesis of Research

Over the last 25 years several researchers have reviewed and summarized the vast literature on Direct Instruction, many using meta-analysis. Meta-analysis is the statistical analysis of a group of previous studies pertaining to a given intervention. The effect size for a teaching methodology reflects the gain in learning produced by the methodology expressed in standard deviation units. Effect sizes are typically based on comparisons to previous outcomes with the same group or outcomes attained during the same time period by a comparison group. An effect of 0.25 or greater is generally said to represent an educationally significant gain or difference.

Adams, G., & Engelmann, S. (1996). *Research on Direct Instruction: 25 years beyond DISTAR*. Seattle, WA: Educational Achievement Systems.

Adams and Engelmann's meta-analysis of 34 selected studies found an average effect size of 0.97 per variable studied for Direct Instruction—an indication that it was highly effective.

Borman, G.D., Hewes, G.M., Overman, L.T., & Brown, S. (2003). *Comprehensive school reform and achievement: A meta-analysis*. *Review of Educational Research*, 73(2), 125-230.

Borman, Hewes, Overman, and Brown examined studies pertaining to 29 comprehensive school reform models. Among the

interventions categorized as having the “strongest evidence of effectiveness” (Direct Instruction, School Development Program, and Success for All), Direct Instruction was found to have the largest average effect size (0.21) and to be grounded in the greatest number of studies—49 studies containing a total of 182 comparisons. The remaining interventions were generally based on less rigorous evidence and fewer studies, and were found to produce widely varying effect sizes.

Hattie, J. (2009). *Visible learning: A synthesis of over 800 meta-analyses relating to achievement*. London and New York: Routledge.

Hattie synthesized the results of previous meta-analyses of various factors that have been investigated with regard to effects on student achievement. Direct Instruction was found to be one of the most effective teaching strategies. Four meta-analyses that included DI were examined. Across 304 studies, 597 effects, and over 42,000 students, he found an average effect size of 0.59 with similar positive results (0.99) for both regular and special education students.

Przychodzin-Havis, A. M., Marchand-Martella, N. E., Martella, R. C., & Azim, D. (2004). *Direct Instruction mathematics programs: An overview and re-search summary*. *Journal of Direct Instruction*, 4(1), 53-84.

The authors reviewed twelve studies of Direct Instruction in mathematics and found significant results favoring DI in eleven of the twelve.

Przychodzin-Havis, A. M., Marchand-Martella, N. E., Martella, R. C., Miller, D. A., Warner, L., Leonard, B., & Chapman, S. (2005). *An analysis of Corrective Reading research*. *Journal of Direct Instruction*, 5(1), 37-65.

The authors reviewed 28 studies and found positive results for Direct Instruction, Corrective Reading in 26 of them.

Schieffer, C., Marchand-Martella, N. E., Martella, R. C., Simonsen, F. L., & Waldron-Soler, K. M. (2002). *An analysis of the Reading Mastery program: Effective components and research review*. *Journal of Direct Instruction*, 2(2), 87-119.

A comprehensive research review of 25 published studies and two large-scale research reviews found results strongly favoring Direct Instruction's Reading Mastery program. Two thirds of the studies reported significant results favoring Reading Mastery/DISTAR Reading, one fifth reported no significant differences, and approximately one seventh (14%) had findings that favored the comparison programs.

What Works Clearinghouse. (2007). *Beginning reading topic report*. Washington, DC: U.S. Department of Education. Retrieved September 20, 2011, from www.education-consumers.org/WWC_read.pdf

In contrast to the several syntheses and meta-analyses noted above, the US Department of Education's What Works Clearinghouse (WWC) concluded that there was insufficient evidence to determine whether Direct Instruction was an effective method for teaching beginning reading. The WWC arrived at its conclusion by ruling that almost all of the published studies on beginning reading instruction (not just studies pertaining to DI) were insufficiently rigorous to be included in the WWC review. Of the 887 studies pertaining to beginning reading instruction, only 27 were deemed to have fully met WWC standards. None were studies of Direct Instruction. Among the studies excluded was the federal government's own 10-year-long comparison of all major approaches to teaching at-risk children—the Follow Through project (see chart on page 12). Follow Through (1965-1975), the largest and most comprehensive study of its kind, was disqualified because it was conducted earlier than 1985. The WWC review is generally viewed as a misstep in the ongoing evolution of the WWC as a resource for educators. WWC's reviews provide little useful guidance as to how educators might choose among the widely used reading programs that are supported by published studies that WWC deems to be technically inadequate. References to the changes that have taken place in the WWC assessment processes and critiques of the WWC assessment of beginning reading programs—too numerous to list here—are available through the Education Consumers Foundation at www.education-consumers.org/WWC.html.

White, W. A. T. (1988). *A meta-analysis of the effects of Direct Instruction in special education*. *Education and Treatment of Children*, 11(4), 364-374. White's (1988) meta-analysis of studies using Direct Instruction with special education populations found an average effect size of 0.84. This study included 12 of the same studies considered in the Adams and Engelmann study, listed above, as well as 13 additional studies, but the results were similar.

Syntheses of Research on Reading Instruction

Two major reviews of reading research sponsored by the federal government do not endorse any specific reading instruction programs; however, they do validate the efficacy of the various practices that are included in Direct Instruction reading programs.

National Reading Panel (2000). *Teaching children to read: An evidence-based assessment of the scientific research literature on reading and its implications for reading instruction*. Retrieved from <http://www.nichd.nih.gov/publications/nrp/upload/report.pdf>

Based on a three-year assessment of thousands of studies, a panel of experts convened by the National Institute of Child Health and Human Development found that effective reading programs have certain key features, all of which are core aspects of Direct Instruction. These include systematic and explicit instruction in phonics and phonemic awareness and the use of decodable text and oral practice formats. The report found that repetition and multiple exposures to vocabulary

items are important and it confirmed the validity of certain DI techniques to improve comprehension. These include question-answering, in which the reader answers questions posed by the teacher and is given immediate feedback as to correctness, and summarization, where readers are taught to integrate ideas and generalize from the text information.

Snow, C. E., Burns, M. S., & Griffin, P. (Eds.). (1998). *Preventing reading difficulties in young children*. Washington, DC: National Academy Press.

The National Reading Council (NRC) report reviewed all of the major studies on reading instruction going back to Chall's 1967 classic, *Learning to Read, The Great Debate*. It affirmed the effectiveness of systematic, code-emphasis programs of direct instruction. In particular, it affirmed the findings of the federal Follow Through project, which had concluded that DI was the only approach, among 22 studied, that accelerated reading achievement in at-risk children. Moreover, the NRC report noted that studies completed subsequent to Follow Through confirmed that the impact of DI on student achievement was long-lasting. In addition, it recommended "Explicit instruction that directs children's attention to the sound structure of oral language and to the connections between speech sounds and spellings" (p. 6). It noted the importance of student motivation and of teaching background knowledge, vocabulary, and "the syntax and rhetorical structures of written language" (p. 6) and recommended "direct instruction about comprehension strategies such as summarizing, predicting, and monitoring" (p. 6)—all features of Engelmann's Direct Instruction.

Project Follow Through: U.S. Office of Education, 1967-1977

Stebbins, L. B., St. Pierre, R. G., Proper, E. C., Anderson, R. B., & Cerva, T. R. (1977). *Education as experimentation: A planned variation model (Vol IV-A)*. Cambridge, MA: Abt Associates. Retrieved from: http://www.eric.ed.gov/ERIC-WebPortal/search/detailmini.jsp?_nfpb=true&_ERICExtSearch_SearchValue_0=ED148490&ERICExtSearch_SearchType_0=no&accno=ED148490

Kennedy, M. M. (1978). *Findings from the Follow Through planned variation study*. U.S. Office of Education. Retrieved from: <https://www.msu.edu/~mkennedy/publications/docs/Federal%20Programs/Follow%20Through/Kennedy%2078%20FT%20findings.pdf>

The Follow Through project was designed to be a horse race in which different models for teaching at-risk children would compete under equitable, exacting conditions to see which, if any, would produce student achievement outcomes superior to the norm for at-risk children. Multiple models of teaching were implemented in 51 school districts over a 10-year period. It was the largest educational experiment ever undertaken, and Direct Instruction was the clear winner among the 9 models that completed the project.

For reasons having to do primarily with educational politics, the Follow Through results were never clearly communicated to school districts and Direct Instruction never received the credit it deserved as a vastly superior methodology for improving basic skills with at-risk children. To the contrary, the low-performing models were provided additional funding on the grounds that they had a greater need for improvement, and a number of them were repackaged and remain in use today. See the figure on page 12 for a summary of the Follow Through outcomes.

The controversy pertaining to the dissemination of the Follow Through outcomes is discussed in the following references: Carnine, D. W. (1983). Government discrimination against effective educational practices. *Proceedings of the Subcommittee on Human Resources Hearing on Follow Through Amendments of 1983*, 99-103. Wash. D. C.: U. S. Government Printing Office. Carnine, D. W. (1984). The federal commitment to excellence: Do as I say, not as I do. *Educational Leadership*, 4, 87-88.

Watkins, California State University-Stanislaus, and "Project Follow Through: In-Depth and Beyond" by Gary Adams, Educational Achievement Systems, Seattle. Engelmann, S. (2007). *Teaching needy kids in our backward system: 42 years of trying*. Eugene, Oregon: ADI Press.

Recent Studies of Direct Instruction

The meta-analyses and reviews of literature described above provide accumulated evidence of many different studies of Direct Instruction. All of the studies confirm that the effects of DI are positive and strong. Similar results appear with recent work. The examples below involve reading and mathematics, general education and special education students, rural and urban settings, and studies that span one year and those that look at multiple years. All of the results have effect sizes very similar to those found in the meta-analyses.

Carlson, C.D., & Francis, D.J. (2003). *Increasing the reading achievement of at-risk children through direct instruction: Evaluation of the Rodeo Institute for Teacher Excellence (RITE)*. *Journal of Education for Students Placed At Risk*, 7(2), 141-166.

In one of the largest multi-year studies of its type, Carlson and Francis examined the effects of the Direct Instruction-based Rodeo Institute for Teacher Excellence (RITE) program on reading achievement of K-2 students. Effects were measured

both yearly and longitudinally across three years. Results indicated that students enrolled in the RITE program consistently outperformed comparison students on standardized reading measures. The study also found that the greater the number of years that students participated in RITE, the more they outperformed comparison students—an indication that the intervention was not transitory or weak on any of the levels of the program. The study involved 9300 students and 277 teachers. All of the outcome measures favored the RITE students, with differences between the intervention and comparison groups growing progressively from K through 2.

Crowe, E. C., Connor, C. M., & Petscher, Y. (2009). Examining the core: Relations among reading curricula, poverty, and first through third grade reading achievement. *Journal of School Psychology, 47*, 187-214.

Crowe, Connor, and Petscher compared growth in oral reading skills over one year for students using six different reading curricula: Open Court, Reading Mastery, Harcourt, Houghton Mifflin, Scott Foresman, and Success for All. Over 30,000 students from the state of Florida were included in the analysis. The researchers found that students studying with Reading Mastery had greater growth than students in other curricula, and the effect size for Reading Mastery versus other curricula in first grade was 0.44.

Kamps, D., Abbott, M., Greenwood, C., Wills, H., Veerkamp, M., & Kaufman, J. (2008). Effects of small-group reading instruction and curriculum differences for students most at risk in kindergarten: Two-year results for secondary- and tertiary-level interventions. *Journal of Learning Disabilities, 41*(2), 101-114.

This study focused on 87 students believed to be at risk for reading failure based on demographic characteristics and skills at entry to school. Participants received small-group reading intervention during first and second grades in either Reading Mastery, Early Interventions in Reading, Read Well, or Programmed Reading. Over time students in Reading Mastery had significantly stronger gains (effect size=0.51-0.66) relative to the other three programs.

Stockard, J. (2010). Promoting reading achievement and countering the “Fourth- Grade Slump”: The impact of Direct Instruction on reading achievement in fifth grade. *Journal of Education for Students Placed at Risk, 15*, 218-240. Previous research has documented a substantial decline in standardized test

scores of children from low-income backgrounds relative to more advantaged peers in later elementary grades—the so-called “fourth-grade slump.” This investigation examined changes in reading achievement from first to fifth grade for students in a large urban school system with a high proportion of economically disadvantaged students. Students were taught reading by Direct Instruction (DI), Open Court, or a mixture of other curricula selected by the individual school. At the outset of the study, the first grade students in the DI schools had lower vocabulary and comprehension scores than students in either of the other two treatment groups. By fifth grade, however, the DI students had the highest vocabulary and comprehension averages—averages that exceeded the fifth grade national average. These impressive results, “suggest that the [DI] curriculum has long-term impacts and, at least for students in this high-poverty school system, can help counter the well documented tendency for declining achievement over time” (p. 234).

Stockard, J. (2010). Improving elementary level mathematics achievement in a large urban district: The effects of Direct Instruction in the Baltimore City Public School System. *Journal of Direct Instruction, 10*, 1-16.

From 1998 to 2003, selected schools in the Baltimore City Public School System (BCPSS) taught mathematics using Direct Instruction. This report compared math achievement for schools using DI with similar schools in the system. First grade students who received Direct Instruction had significantly higher levels of achievement on the Comprehensive Test of Basic Skills (CTBS) subtests of mathematics computations (effect size = .25) and mathematics concepts and applications (effect size = .32; $n > 40,000$). Among the students who began first grade in the BCPSS and remained in the same schools five years later as fifth graders ($n > 4,000$), those who had received Direct Instruction as first graders had significantly higher scores on the measure of mathematics concepts and applications than students attending the other schools.

Stockard, J. (2011). Increasing reading skills in rural areas: An analysis of three school districts. *Journal of Research in Rural Education, 26*(8), 1-19. Retrieved from <http://jrre.psu.edu/articles/26-8.pdf>

In a study of 1600 students attending schools in rural Midwestern districts, Stockard examined the changes in reading skills brought about by the Direct Instruction Reading Mastery program. Students who received the DI curriculum from the beginning of kindergarten (full exposure cohorts) were compared to those who began the curriculum in later grades. Those in the full exposure cohorts had significantly higher reading skills than students in the other cohorts, and their scores were at or above national averages. In the one district for which scores on a statewide reading assessment were available, the percentage of students scoring at a high level went from well below the state average to above the state average in the five years of the study (effect size = .31).
